

Lab 4 – Vibe Coding Chat History

Project: Brick Breaker (#49) • Task 1: Collision Detection

USER

what should i do?

ASSISTANT

Lab 4 is a Git + Vibe Coding assignment. The workflow is: identify the assigned repository, read its README, clone it, run the original game, record the 10-second before video, use an LLM to fix the broken code and implement the README features one by one, record the final 10-second video, push to the personal repository, and keep separate commits for each task.

USER

49

ASSISTANT

Your assigned repository is #49 — Brick Breaker. The next step is to clone the assigned repository and read its README before modifying anything.

USER

Repository cloned successfully. Files: game, main.py, README.md, requirements.txt.

ASSISTANT

The repository was cloned successfully. Next, read the README with `cat README.md` and do not modify the code yet.

USER

README shows four tasks: 1 Refine Collision Detection; 2 Implement Game Over Condition; 3 Add Replay Option; 4 Add Sound Feedback.

ASSISTANT

The README defines four tasks: improve collision detection, add a win/loss screen, add replay with Easy/Medium/Hard difficulty, and add sound feedback. First install dependencies and run the original game. Record the required 10-second before video before changing code.

USER

pip install -r requirements.txt gives: zsh: command not found: pip

ASSISTANT

Use `python3 -m pip install -r requirements.txt`, then run the game with `python3 main.py`. Do not modify the code yet.

USER

video recorded

ASSISTANT

The before-video is done. Next inspect the Git state and source files before starting Task 1.

USER

python3 main.py runs. git status shows only generated `__pycache__` changes; git log shows Initial Brick Breaker starter.

ASSISTANT

The original game runs and the repository starts from the initial starter commit. Generated `__pycache__` files should not be committed.

USER

code . gives: zsh: command not found: code

ASSISTANT

The VS Code ``code`` launcher is not installed in PATH. Open VS Code through the GUI using File → Open Folder and select ``/Users/harshithkumar/49_brick-breaker``.

USER

what next?

ASSISTANT

Open the project in VS Code, open the Vibe Coding/AI assistant, and use a Task 1-only prompt to fix collision detection without implementing Tasks 2–4.

USER

changes are done

ASSISTANT

Run the game and test the collision behavior. Then inspect ``git status`` and ``git diff``; do not commit until the actual Task 1 change is verified.

USER

Collision code now uses `previous_rect` to determine left/right hits. Commit created: 8bff449 Fix collision detection. git push fails with HTTP 403.

ASSISTANT

Task 1 was committed successfully as commit ``8bff449 Fix collision detection``. The push failed because ``origin`` still points to the SETAPESU26 starter repository, where the account does not have push permission.

USER

git remote -v shows origin `https://github.com/SETAPESU26/49_brick-breaker.git`

ASSISTANT

Create an empty repository under your personal GitHub account, change the local origin to your repository URL with ``git remote set-url origin ...``, verify with ``git remote -v``, and then run ``git push -u origin main``. Do not force-push.

Task 1 status

Local commit created: **8bff449 Fix collision detection**. The push to the SETAPESU26 starter repository failed with HTTP 403 because the remote repository does not grant push access. The next action is to point ``origin`` to the student's personal GitHub repository and push the existing commit.
